SENDGRID INTEGRATION WITH PYTHON

Date	15 NOV 2022
Team ID	PNT2022TMID02790
Project Name	NUTRITION ASSISTANT
	APPLICATION

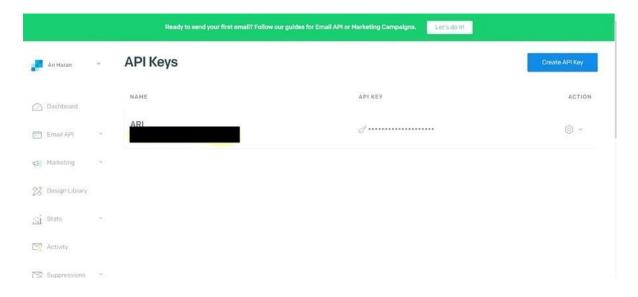

STEP 1:

REQUIREMENTS:

Python 2.6, 2.7, 3.4 or 3.5.

STEP 2:

Create an API key

STEP 3:

INSTALL

PAKAGE: > pip installsendgrid

SETP 4:

SEND EMAIL

SENDGRID PYTHON CODE:

```
import os
2
  from sendgrid import SendGridAPIClient
  from sendgrid.helpers.mail import Mail
4
5
  message = Mail (
6
       from email='from email@example.com',
7
       to emails='to@example.com',
8
       subject='Sending with Twilio SendGrid is Fun',
       html_content='<strong>and easy to do anywhere, even with
   Python</strong>')
10 try:
       sg = SendGridAPIClient(os.environ.get('SENDGRID_API_KEY'))
12
       response = sg.send(message)
13
      print(response.status_code)
14
      print (response.body)
15
      print (response.headers)
16 except Exception as e:
      print(e.message)
```

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
import urllib2 as urllib
17 _logger = logging.getLogger(__name_)
      def __init__(self, response):
          :param response: The return value from a open call
                           on a urllib.build opener()
          :type response: urllib response object
          self. status code = response.getcode()
          self._body = response.read()
          self._headers = response.info()
34
      def status_code(self):
      def body(self):

          return self. headers
          :return: dict of response from the API
          if self.body:
               return json.loads(self.body.decode('utf-8'))
65 class Client (object):
                    host,
                    request headers=None,
74
                    url path=None,
                    append slash=False,
           :param host: Base URL for the api. (e.g.
  https://api.sendgrid.com)
           :type host: string
           :param request headers: A dictionary of the headers you want
```

```
applied on all calls
           :type request headers: dictionary
           :param version: The version number of the API.
                           Subclass build versioned url for custom
  behavior.
                           Or just pass the version as part of the URL
87
           :type version: integer
           :param url path: A list of the url path segments
           :type url path: list of strings
          self.host = host
           self.request headers = request headers or ()
           self. version = version
           self. url path = url path or []
           self.append slash = append slash
          self.timeout = timeout
               Or just pass the version as part of the URL
104
               (e.g. client. (1/v31))
            :param url: URI portion of the full URL being requested
106
            :type url: string
107
            return '()/v()()'.format(self.host, str(self. version),
  url)
110
111
        def build url(self, query params):
112
113
114
            :param query_params: A dictionary of all the query
```

```
parameters
115
            :type query params: dictionary
117
118
119
            while count < len(self. url path):
                url += '/()'.format(self. url path[count])
121
122
123
124
            if self.append slash:
126
                url += 1/1
127
128
            if query params:
                url values = urlencode(sorted(query params.items()),
130
131
132
133
                url = self. build versioned url (url)
134
135
136
137
138
        def update headers(self, request headers):
139
140
            :param request headers: headers to set for the API call
142
            :type request headers: dictionary
            :return: dictionary
144
            self.request_headers.update(request_headers)
146
        def _build_client(self, name=None):
147
```

```
148
            :param name: Name of the url segment
            :type name: string
            url path = self. url path + [name] if name else
  self. url path
                           request headers=self.request headers,
                           url path=url path,
                           append slash=self.append slash,
        def make request(self, opener, request, timeout=None):
            :param opener:
            :type opener:
            :param request: url payload to request
            :type request: urllib.Request object
170
            :return: urllib response
173
174
175
176
                return opener.open(request, timeout=timeout)
            except HTTPError as err:
178
179
                exc. cause = None
                 logger.debug('(method) Response: (status)
```

```
method=request.get method(),
                    status=exc.status code,
                    body=exc.body))
184
               raise exc
186
187
               (e.g. /your/api/(variable_value)/call)
189
               Another example: if you have a Python reserved word,
190
               in your url, you must use this method.
191
            :param name: Name of the url segment
           :type name: string
194
195
196
        def getattr (self, name):
198
               (e.g. client.name.name.method())
               You can also add a version number by using
            :param name: Name of the url segment or method call
204
            :type name: string or integer if name == version
            :return: mixed
            if name == 'version':
               def get version (*args, **kwargs):
210
                   :param args: dict of settings
211
                   :param kwargs: unused
```

```
212
213
214
                    self. version = args[0]
216
                return get version
217
218
219
            if name in self.methods:
220
                method = name.upper()
221
                def http request (
223
                        request body=None,
224
                        query params=None,
                        request headers=None,
227
229
                    :param timeout: HTTP request timeout. Will be
  propagated to
230
                        urllib client
231
232
                    :param request headers: HTTP headers. Will be
  merged into
233
                        current client object state
234
                    :type request_headers: dict
235
                    :param query params: HTTP query parameters
236
                    :type query params: dict
237
                    :param request_body: HTTP request body
                    :type request body: string or json-serializable
238
239
                    :param kwargs:
240
241
242
                    1 request headers:
```

```
243
                        self. update headers(request headers)
244
245
                    If request body is None:
246
